Initial manoeuvre

You are driving an automatic car. How do you control the speed when you need to drive very slowly?

I alternate between giving a little gas, coming off the gas, giving a little gas again and so on.

**I alternate between coming off the brakes, braking lightly again, coming off the brakes and so on.**

An automatic car starts moving when you select D and come off the brakes. This means that you do not need to use the accelerator. Instead, you use the brakes to control the speed.

Initial manoeuvre

You are driving a manuell car. Do you have to put the gear in neutral before you make a full stop?

☐ No, but I have to shift to gear 1

☒ **No, but I have to press down the clutch**

You can therefore stop with any gear. But do not forget to push down the clutch just before you stop, so that the car does not stall. With an automatic car, you only need to brake.

☐ Yes, otherwise the car will stall

Initial manoeuvre

You are driving a manuell vehicle. Do you need to press down the clutch before you do a complete stop?

☒ Yes, if I don't do that my vehicle will stall

A gear needs to be disconnected before stopping. You can do this by pressing the clutch just before you stop. Driving an automatic vehicle, you just need to brake.

☐ No, it is fine to stop in any gear

Initial manoeuvre

You have stopped your car at the roadside so that you can get out for something you left in the boot. What is extra important to do before you open the door?

**Look in the left wing mirror and over my shoulder (the blind spot).**

You are responsible for ensuring you can open the door without risk. If you do not look in your mirror and over your shoulder, you may not see that traffic is approaching.

Look in the right wing mirror to check that I am really near the edge of the road.

Switch on the hazard warning lights so that it is easier to see me.

Initial manoeuvre

You are driving a manuell car. What gear should you usually use, when starting and driving off?

☒ First

There are exceptions. If there is a lot of snow, so that the tyres are slipping, it may be good to use the 2nd gear. This makes the car a bit "heavier" and does not slip so easily. In an automatic car you don't have gears, you just need to give some gas.

☐ Second

How much gas should you normally give when driving slowly on the clutch?

☐ Half gas

☐ Enough to hear that the engine is running at a higher speed

☒ None

There are vehicles that themselves provide gas when clutch begins to lift, but you do not usually need to gas at all. One exception may be uphill

When must you indicate?

☐ When I stop at the side of the road

☒ When I start from the side of the road

You should yield when starting from the side of the road, be sure there is no one before you drive off.

☐ When reversing

You are driving a manual car. How do you regulate the speed when slow driving?

☒ With the clutch

Lifting the clutch into the pulling position and then pushing it slightly down, gives you a very slow speed and that may be needed when you park.

☐ With the hand brake

☐ With the accelerator

When does the brake light on your car come on?

☒ When I press the brake pedal

Even with a little pressure on the brake pedal, the brake lights come on. This is good as it is sometimes necessary to warn traffic behind you.

☐ When I press the clutch

☐ When I use the parking brake
